Terraform Cheatsheet

Terraform is an open-source tool for provisioning, managing, and versioning infrastructure as code. It allows developers to define and manage infrastructure using high-level configuration files written in HashiCorp Configuration Language (HCL).

A Terraform cheatsheet is important for several reasons:

- **Quick Reference:** Terraform has a large number of commands and options, and a cheatsheet serves as a quick reference for the most commonly used commands and options.
- **Increased Productivity:** Having a Terraform cheatsheet readily available can increase productivity by reducing the time spent searching for information and commands.
- **Consistency:** A cheatsheet can help ensure consistency in the use of Terraform, making it easier to maintain and manage infrastructure.
- **Onboarding:** A Terraform cheatsheet can be a useful resource for new users, helping them to become familiar with the tool and its capabilities.
- **Best Practices:** A Terraform cheatsheet can include best practices and tips for using Terraform, making it a valuable resource for both new and experienced users.

Command	Description
<code>terraform init</code>	Initialize a Terraform working directory.
<code>terraform plan</code>	Generate an execution plan for Terraform.

Command	Description
<code>terraform apply</code>	Apply changes to infrastructure based on a Terraform plan.
<code>terraform destroy</code>	Destroy Terraform-managed infrastructure.
<code>terraform show</code>	Show the details of a Terraform plan or state file.
<code>terraform output</code>	Output the values of Terraform variables.
<code>terraform graph</code>	Show the dependencies between Terraform resources.
<code>terraform taint</code>	Force the recreation of a Terraform resource.
<code>terraform state list</code>	List all the Terraform resources of a specific type.
<code>terraform state show</code>	Show the details of a specific Terraform resource.
<code>terraform state push</code>	Save the current Terraform state to a file.
<code>terraform state pull</code>	Load a Terraform state from a file.
<code>terraform state pop</code>	Reset the Terraform state to its prior state.

Command	Description
<code>terraform -debug</code>	Run a Terraform command in debug mode.
<code>terraform console</code>	Run Terraform in an interactive mode.
<code>terraform -dir</code>	Run Terraform with a specific configuration directory.
<code>terraform -backend-config</code>	Run Terraform with a specific Terraform backend.
<code>terraform -state</code>	Run Terraform with a specific Terraform state file.
<code>terraform -var-file</code>	Run Terraform with a specific Terraform variable file.
<code>terraform -var</code>	Run Terraform with a specific Terraform var value.
<code>terraform workspace select</code>	Run Terraform with a specific Terraform workspace.
