Top Git Interview Questions and Answers in 2024

Let's read some of the top Git interview questions and answers in 2024 that are asked by interviewers:

Q1. What is Git?

[Git](#) is a version control system for tracking changes in computer files and is used to help coordinate work among several people on a project while tracking progress over time. In other words, it's a tool that facilitates source code management in software development.

Q2. What do you understand by the term 'Version Control System'?

A version control system (VCS) records all the changes made to a file or set of data, so a specific version may be called later if needed. This

helps ensure that all team members are working on the latest version of the file.

Q3. What is GitHub?

To provide Internet hosting for version control and software development, GitHub makes use of Git.

Q4. What benefits come with using GIT?

- Data replication and redundancy are both possible.
- It is a service with high availability.
- There can only be one Git directory per repository.
- Excellent network and disc performance are achieved.
- On any project, collaboration is very simple.

Q5. What's the difference between Git and GitHub?

Git	GitHub
Git is a software	GitHub is a service
Git can be installed locally on the system	GitHub is hosted on the web
Provides a desktop interface called git GUI	Provides a desktop interface called GitHub Desktop.
It does not support user management features	Provides built-in user management

Q6. What is a Git repository?

A Git repository refers to a place where all the Git files are stored. These files can either be stored on the local repository or on the

remote repository.

Q7. How can you initialize a repository in Git?

If you want to initialize an empty repository to a directory in Git, you need to enter the `git init` command. After this command, a hidden `.git` folder will appear.

Q8. Name a few Git commands with their function.

- `Git config` – Configure the username and email address
- `Git add` – Add one or more files to the staging area
- `Git diff` – View the changes made to the file
- `Git init` – Initialize an empty Git repository
- `Git commit` – Commit changes to the head but not to the remote repository

Q9. What is the correct syntax to add a message to a commit?

```
git commit -m "x files created"
```

Q10. Which command is used to create an empty Git repository?

`git init` – This command helps to create an empty repository while working on a project.

Q11. What does `git pull origin master` do?

The `git pull origin master` fetches all the changes from the master branch onto the origin and integrates them into the local branch.

```
git pull = git fetch + git merge origin/ master
```

Q12. What does the git push command do?

The Git push command is used to push the content in a local repository to a remote repository. After a local repository has been modified, a push is executed to share the modifications with remote team members.

Q13. Difference between git fetch and git pull.

Git Fetch	Git Pull
The Git fetch command only downloads new data from a remote repository.	Git pull updates the current HEAD branch with the latest changes from the remote server.
It does not integrate any of these new data into your working files.	Downloads new data and integrate it with the current working files.
Command – git fetch origin git fetch –all	Tries to merge remote changes with your local ones.Command – git pull origin master

Q14. What do you understand about the Git merge conflict?

A Git merge conflict is an event that occurs when Git is unable to resolve the differences in code between the two commits automatically. Git is capable of automatically merging the changes only if the commits are on different lines or branches.

Q15. What is the functionality of git ls-tree?

The git ls-tree command is used to list the contents of a tree object.

Q16. What is the process to revert a commit that has already been pushed and made public?

There are two processes through which you can revert a commit:

1. Remove or fix the bad file in a new commit and push it to the remote repository. Then commit it to the remote repository using: git

`commit -m "commit message"`

2. Create a new commit to undo all the changes that were made in the bad commit. Use the following command: `git revert <commit id>`

Q17. What does git clone do?

Git clone allows you to create a local copy of the remote GitHub repository. Once you clone a repo, you can make edits locally in your system rather than directly in the source files of the remote repo

Q18. What do the git reset –mixed and git merge –abort commands do?

`git reset –mixed` is used to undo changes made in the working directory and staging area.

`git merge –abort` helps stop the merge process and return back to the state before the merging began.

Q19. What do you understand about the Staging area in Git?

The Staging Area in Git is when it starts to track and save the changes that occur in files. These saved changes reflect in the `.git` directory. Staging is an intermediate area that helps to format and review commits before their completion.

Q20. How do you find a list of files that has been changed in a particular commit?

The command to get a list of files that has been changed in a particular commit is: `git diff-tree -r {commit hash}`

- `-r` flag allows the command to list individual files
- commit hash lists all the files that were changed or added in the commit.

Q21. What is the use of the git config command?

The `git config` command is used to set git configuration values on a global or local level. It alters the configuration options in your git

installation. It is generally used to set your Git email, editor, and any aliases you want to use with the git command.

Q22. What is the functionality of the git clean command?

The git clean command removes the untracked files from the working directory.

Q23. What is SubGit and why is it used?

SubGit is a tool that is used to migrate SVN to Git. It transforms the SVN repositories to Git and allows you to work on both systems concurrently. It auto-syncs the SVN with Git.

Q24. If you recover a deleted branch, what work is restored?

The files that were stashed and saved in the stashed index can be recovered. The files that were untracked will be lost. Hence, it's always a good idea to stage and commit your work or stash them.

Q25. Explain these commands one by one– git status, git log, git diff, git revert <commit>, git reset <file>.

- Git status – It shows the current status of the working directory and the staging area.
- Git revert<commit> – It is used for undoing changes to a repository's commit history.
- Git log– It is a key tool for reviewing and reading the history of everything that happens to a repository.
- Git diff– It is a multi-purpose Git command that performs a diff function on Git data sources when executed.
- Git reset<file>– it is used to unstage a file.

Q26. What exactly is tagging in Git?

Tagging enables developers to mark all significant checkpoints as their project progress.

Q27. What exactly is forking in Git?

It is a repository duplicate and forking allows one to experiment with changes without being concerned about the original project.

Q28. How to change any older commit messages?

You can change the most recent commit message with the `git commit --amend` command.

Q29. How to handle huge binary files in Git?

Git LFS is a Git extension for dealing with large and binary files in a separate Git repository.

Q30. Name a few GIT tools.

Git comes with a few built-in tools like Git Bash and Git GUI.

Q31. Will you make a new commit or amend an existing one?

The `git commit --amend` command allows you to easily modify the most recent commit.

Q32. What do you mean by branching strategy?

It is employed by a software development team while writing and managing code with a version control system.

Q33. Difference between head, working tree, and index.

They are all names for various branches. Even Though a single git repository can track an arbitrary number of branches, the working tree is only associated with one of them, and HEAD points to that branch.

Q34. Is there a git GUI client available for Linux?

Git includes built-in GUI tools for committing (git-gui) and browsing (gitk), but there are a number of third-party tools available for users seeking platform-specific experience.

Q35. What is the benefit of a version control system?

Version control enables software teams to maintain efficiency and agility while the team grows by adding more developers.

Q36. State the difference between “git remote” and “git clone”?

“Git remote” allows you to create an entry in the git configuration which specifies a URL.

“Git clone” lets you create a new git repository by letting you copy it from the current URL.

Q37. Difference between “pull request” and “branch”?

“Pull request” is done when you feel like changing the developer’s change to another person’s code branch. And “Branch” is just a separate version of code.

Q38. What are Git Hooks?

They are scripts that are executed automatically whenever a specific event occurs in a Git repository.

Q39. What is the standard method for branching in GIT?

In GIT, the best way to create a branch is to have one ‘main’ branch and then another branch for implementing the changes that we want to make.
