

Wipro Angular Interview Questions

Here is the list of Angular Interview Questions which are recently asked in Wipro company. These questions are included for both Freshers and Experienced professionals. Our **Angular Training** has Answered all the below Questions.

As per my observation, the Company conducts three rounds for the selection process.

These rounds are as follows:

- Written Exam
- Technical Interview
- HR Interview

Wipro Angular Interview Questions

1. What is an Angular Material?

Angular Material is a User Interface component library. It provides

- reusable UI components,
- speeds up the development of consistent user interfaces.

It enables professionals to create a uniform, fully functioning website, web pages, and web apps.

2. What is Angular framework?

AngularJS is an open-source web application framework. AngularJS is a structural framework for dynamic web applications. It lets you use HTML as your template language and lets you extend HTML's syntax to express your application components clearly and succinctly.

3. What is TypeScript?

Simply, TypeScript is a free, open source programming language. It is developed by Microsoft. TypeScript is a syntactical superset of JavaScript. It is recommended for its consistency. So It is easy to maintain and comfortable to interpret.

4. What is a decorator in Angular?

Decorators are functions that define the working of Angular features. It is used to isolate the decoration of a class without code modification. The main purpose of Angular decorators is to store metadata about a class, method, or property. The types of decorators are:

- Class.
- Property.
- Method.
- Parameter.

5. What is the difference among "declarations", "providers" and "import" in NgModule?

scope and they are injected to other services or directives that have them as dependency.

- import makes the exported declarations of other modules available in the current module.

6. What are the key components of Angular?

The few key components are:

- Templates represent the views of an Angular application.
- Services used to create components which can be shared across the entire application.
- Metadata can be used to add more data to an Angular class.
- Databinding: Binding markup is responsible for connecting application data with the DOM.

7. Explain the Architecture overview of Angular.

Angular is a framework for building client applications in HTML and either JavaScript or a language like TypeScript that compiles to JavaScript. The framework consists of several libraries, some of them core and some optional. Then you launch the app by bootstrapping the root module.

8. What are the key benefits of using Angular as a framework?

- Angular is an opinionated platform that allows users to build scalable user interfaces.
- Angular's forms and routing provide stability and integration. It makes easy development of web applications.
- Angular framework provides two-way data binding that synchronizes the data between Model and View.
- Angular uses TypeScript which is a strongly typed language. It is easier to read and maintain.
- To create an enjoyable development experience, Angular is compatible with a large network of libraries, tools, frameworks.

9. Static and public in angular.

The static members can be defined by using the keyword static TypeScript includes the keywords public, protected, and private to control access to the members of a class i.e. properties or methods.

10. Difference between Promises and observable.

The observables and promises help us work with asynchronous functionality in JavaScript. Promises deal with one asynchronous event at a time, while observables handle a sequence of asynchronous events over a period of time.

11. Reversing a number in an array.

reverse() method reverses the element of an array. The first array element becomes the last and the last becomes the first.

```
Syntaxarray.reverse();
```

Return Value

Returns the reversed single value of the array.

12. TypeScript data type

The Common data types in TypeScript are: number , string , boolean , enum , void , null , undefined , any , never , Array and tuple.

13. What is strict mode in JS?

JavaScript's strict mode, introduced in ECMAScript 5, is a way to opt in to a restricted variant of JavaScript, thereby implicitly opting-out of "sloppy mode". It eliminates some JavaScript silent errors by changing them to throw errors.

14. What do you mean by String Interpolation?

string interpolation is the process of evaluating a string literal that contains one or more placeholders. It yields a result in which the placeholders are replaced with their values. String interpolation in Angular is used to display dynamic data on an HTML template.

15. What are template expressions in Angular?

A template expression produces a value and appears within double curly braces, `{{ }}`. Angular resolves the expression and assigns it to a property of a binding target. The target could be an HTML element, a component, or a directive.

16. What is an AOT compilation in Angular?

The Angular ahead-of-time (AOT) compiler converts the Angular code into JavaScript code. The conversion happens before the browser downloads and runs the code. To achieve faster rendering in the browser, Compile your application during the build process.

17. What are modules in Angular?

A module is a mechanism or container to group the components, directives, pipes and services. It helps to encapsulate the code that deals with several aspects of an application. Developers can create modules using the `NgModule` decorator.

18. What is the difference between component and directive?

Component is a directive which use shadow DOM to create encapsulate visual behavior called components whereas directives is used to add behavior to an existing DOM element. Component is used to break up the application into smaller components. Directive is use to design re-usable components.

19. What is the Document Object Model?

The Document Object Model (DOM) is a programming API or object oriented representation for web documents. It represents the page and allows you to make changes. The DOM follows traditional object oriented design.

20. What is a module?

The module is a mechanism to group components, directives, pipes and services that are related and can be combined with other modules to create an application Module.

21. What does Angular Material mean?

Angular Material is a User Interface component library. It is used to speed up the development of the user interfaces. Angular Material offers reusable and beautiful UI components. It allows to develop fully functional web pages, and applications.

22. What is output for typeof (null)?

the `typeof` operator always returns a string with the type of the operand passed to it. If the resultant type of the expression is, for example, a number, what will be returned is "number".

23. What is event listener and Host listener in Angular?

`HostListener` – Declares a host listener and will invoke the decorated method when the host element emits the specified event. `@HostListener` – listen to the event emitted by the host element that's declared with `@HostListener`. `.HostBinding` – Declares a host property binding.

24. What is Shadow DOM?

Shadow DOM basically allows group of DOM implementation to be hidden inside a single element and encapsulate styles to the element. Shadow DOM tree starts with a shadow root, underneath which can be attached to any elements.

25. What is Buffer (window storage)?

A buffer is like a cache that is a data area of computer memory (RAM) reserved for temporary storage. For example, when you press several keys in quick succession on the keyboard, the

25. How did you hide (not hide) the element in jQuery?

hide ()-The matched elements will be hidden immediately, with no animation. The jQuery: hidden selector can be used to test whether an element is hidden or not on a page.
